SKILLS

Ruby on Rails, PHP, Golang, MySQL, PostgreSQL, Redis, MongoDB, Bitbucket (CI/CD),
Grafana (Logging), Datadog (Monitoring & Alerting)

EXPERIENCES

Ruparupa, Jakarta - *Software Engineer*

September 2025 - Present

- Led the organization-wide transition from Gitflow to Trunk-Based Development (TBD) as the Subject Matter Expert, designing the branching strategy and CI/CD adjustments to improve development velocity and reduce merge complexity across ruparupa engineering teams/organization (8 teams, 62 services/repositories).
- Introduced a database migration strategy using sqitch to standardize schema change management across services in a shared-database consisting of 727 tables consumed by 62 backend services (premature microservices), improving traceability, collaboration, and deployment safety. Previously there is no db migration, no local development (all of the engineers must connect staging database to their local project).
- Initiated and designed the migration from NGINX to Kong API Gateway, establishing a centralized gateway architecture to replace premature BFF, improve routing flexibility, traffic management, and long-term scalability..
- Implemented zero-downtime schema migrations using Percona pt-online-schema-change (pt-osc) to safely alter large production tables that previously required downtime, including altering the vouchers table monetary column (DECIMAL(10,2)) which removed the 99M voucher value limit and unblocked a B2B transaction deal involving 2 Billion transaction requests.
- Improve observability and alerting using grafana and prometheus. Previously there is a lot of blind spots (knowing the incident from the user complaints).
- **Tech Stack:** Golang echo, MySQL, MongoDB, Sqitch migration, Git, Grafana, and etc.

Mekari - *Software Engineer*

December 2021 - August 2025

- Contributed to initiating and building the core backend APIs for Mekari Sign from scratch (I was one of the first engineering team members), enabling the product to onboard 50,000+ users within the first 12 months of launch.

- Implemented a Subscription Management system (packages, quotas, pricing), contributing to a 30% increase in monetization feature adoption.
- Contributed to the development of User and Workspace Management modules, supporting 100+ companies.
- Contributed to an Approval Workflow system that processed 1,000+ approval requests across 100+ companies.
- Contributed to a Role-Based Access Control (RBAC) system supporting 5+ user roles for internal ModPanel users.
- Built an Access Request system that allows the users to share documents (similar to google drive access request feature).
- Integrated Talenta Document Template, enabling cross-platform integrations with zero major issues after deployment.
- Migrated 25+ legacy background jobs (active job) to new Sidekiq workers with retry mechanisms.
- Implemented mobile push notifications using Firebase with <1% failure rate.
- Implemented a Reclaim Quota mechanism, recovering unused quotas per month for VIP clients.
- Applied Test-Driven Development (TDD) using RSpec, maintaining >95% test coverage.
- And many more.
- **Tech Stack:** Ruby on Rails, PostgreSQL, Redis, Sidekiq, RSpec, Datadog, Grafana, Bitbucket, and etc.

Admedika (Telkom Group), Jakarta - *Software Engineer*

December 2020 - November 2021

- Developed and maintained healthcare applications used by **insurance providers and third-party healthcare services**.
- Built and enhanced application features using **CodeIgniter and OracleDB**.
- Identified and resolved bugs while implementing new features based on business requirements.

AsiaCommerce, Surabaya - *Software Engineer*

May 2020 - November 2020

- Developed and maintained supply chain marketplace web applications using Laravel and Vue.js.
- Refactored legacy code to improve modularity, maintainability, and code quality.
- Fixed application bugs and implemented new features based on stakeholder requirements.
